This affects ocean circulation and the ability of the ocean

to absorb more GHGs and heat. 162 Enhanced sea ice export to lower latitudes gives rise to local salinity anomalies (such as the Great Salinity Anomaly 163) and therefore to changes in ocean circulation and air–sea exchanges of momentum, heat, and freshwater, which in turn affect the atmospheric distribution of heat and GHGs.

The Millenium Ecosystem Assessement (2005) 542 proposed four classes of ecosystem services: provisioning, regulating, supporting and cultural services (Cross-Chapter Box 8 in Chapter 6). These ecosystem services in drylands are vulnerable to the impacts of climate change due to high variability in temperature,

precipitation and soil fertility (Enfors and Gordon 2008 543 ; Mortimore 2005 544 ).
